

BASIC STRUCTURE AND INSTALLATION

BSSE II CSSE 402 Assembly directives are instructions that direct the assembler to do something. They are not converted to machine code. There are different directives in assembly language, some of them are;

- .model
- .stack
- .data
- .code
- Db, dw, dt

```
;Title of the program
Dosseg
.model small
.stack 100h
.data
       ; variables are defined here
.code
Main proc ; procedure start
       ; executable instructions
Main endp ; procedure end
End main
```

Program Structure 10 understand program structure, Instructions. -> . model directive (1) - model Work is to define our assembly code (Any file Doc, text, it has HD space reserved in mB, GB). When we reen it divide it from cov and sun it? RAM Access tirst me reseme part of our program in RAM, our code access by CPU & understand what is our Program and behave.

What space we need in RAM. Every Progambig language has used 2 segments Dala segments & code segment. Idatel One is data define and offer is RAM execute it. We need 2 spaces in Assembly. In date, Variables are défine code, instructions are written. What space needed? (for both <=64KB) Ting code+Dala < = 64kB. Small code <= 64 kB, Dola <= 64 kB (For seperate gode & edecatures

code = Anysize, Dala <= 64kB. Medium Code <= 64kB, Dala = Anysize. Compact code = Anysize, Dala = Anysize. large Code = Anysize, Dala = Anysize Huge We used small, don't reseve large space of RAM · model directive -> "Specifics the total amount of memory the pregram would take." 2). We used stack memory, stack management, data first put refreie last. ue haie to define it. If we take stack in RAM have to define it.

· Stack look · shize. Hexadecimal define the size, Orly define wif ne used stack. . Stack Segment Directive Specifice the storage for 3 dala Dala Segment Directie Any values we define here, go to data (RAM). Variables are defined here, it has segment where all data is sewed. Variables this part of RAM is reserve

(4) code Code Segment Directive -> Between data & code ne définéed vaniables. · Instruction which we want to sur, code is withen, it is reserved in RAM. (5) End Main: End of program. De decode aux avoite de de de donte de strock Sample . model small . stack 100h. ; variables defined here. ; here ne write our code. Find Main

On code le write executable instructions. Aflée it we write our program. Main proc ->. If our program for only one work write procedure l'write our We use any name rather then Proc. We made any proc under Manpoor. We work on one procedure. Main endp

Now ne write code to point à character.

End Main.

We used Acco. Reg for 1/0.

Acco. go to dala Reg, take value from these and point. Thist Character send to Data Register. Mor all, 'A' This is immediate addressing One Reg is Must. mode. mor 'B', 'A' X Meu 2,3 X Mor dl, 'A' Mov dl. Ax x Mov dx, Ax mov dh, al Type Match is must.

Syntax Rule 1) space is necessary after Opcode (space after Mou). 2) One operand must be General purpose Register. 3) Operands must be of same lize.
4) Comma blu Operande. Now to print A -> 2 is service routine for single Characles print. Movah, 2 INT 21h. Now we are in register, we have to relien from register and use the service routhe. INT 214.

These are part of hardware Interaction, there two are part of program. Mor ab, 4eH I you forget the arrangement of lines then write dosseg before starting of program -> dosseg -> Dos segment -> Manages the assangement (Automatially arranges). I segmente in a progen. > ; comment (Used for comment).

DosBox, MASM, LINK. Emulator -> Environment provide facility to seen fregram / software of Assembly program. Manufectueed by July . 22, 2002 peter Vænstra. Advantages (Why DosBox). why not MASM Emulator by Ms itself. " Voual Studio with kiplowine 1) free software, no need to crack/puchase. 2). Light simple easy to use. 3) Run on every environment Linux, Android, Windows, 4). Mac. Can learn Debugging (9 dentity & covered mistakes).

(an guip to Syntax.

In DosBox We made Assembly larg. Prog. to
Connect into exe fle we need MASM & LINK. (Convert Assembly code to executable code) · 10 charge Assembly code to Object file we need Assemblee MASM · DosBox -- > MASM -- > Objectfile -- > linker -Machine Code. · Filerame. asm MASM, Filename. obj Linker Filename. exe

Comande do areale vere 1800 Commande to treate file and Run of DosBox. To create new file, or view a file. Edit Filename. asm. -> If no file exict it create new, or it she exist it open it for edit. To Run a file We need assembles. connect file into obj MASM Filename asm; To change into Obj to change into exe. LINK Filename. obj; Filename. exe!

is not required. and LINK, backend processing

1) Download it. 2) Extract. 3) Install DosBox 4) Installed. 5) Copy mp folder (MASM and LINK), go to main C drie and paste it. 6). Open Dos Box. 9t is another environment, built in devie We have to go to MP folder. Correction. Give path, MP folder mounts in DosBox with name of C, like C drie MP folder connected Path is linked now. mount e c: MP

Program to print a single character on screen

.model small

.stack 100h

.data

.code

Main Proc

Mov dl,'A'

Mov ah, 2

INT 21h

Mov ah, 4ch

INT 21h

Main endp

End Main
