

JUMP, CONDITIONAL JUMP, UNCONDITIONAL JUMP

Instructions to print a one time Mor dla mou ah, 2 int alh . Program Jump and sun again, change its position. Mor ah, I > take input. int 21h. > compare input with al. mou al, 3 If you want to compale your input with all if both equal it Mou as, 4ch int 21h. again take 1/P from user. It jump not equal it run downward.

-> It jump only according to condition, we write.

-> jump move from one place to another. Jump is an instruction to control the program flow.

Slow. (With condition or not). Types of Jump. :- (i) Unconditional jump. (1) Unuonditional jump: mov all, a' send a to all and print it again want to jump, how to do it intally

-> We used label where we want to go.

(Need space, location, address to jump). label without any condition (Unconditional · Jump to Syntax :mov dl, a Imp Label] mou ah, 2 int alh Jmp L1 In program, it jump to · label present in any place that label. (ii) Conditional jump jump to label ruhen condition occur.

Syntax :-(opeode means variety of conditions, =,>,<,<=,etc. Opcode Label 1) for example For this program, ne take input & compare mou ah, 1 if both equal it jump. int alh So the condition is equal mou del, 3 to JE (jump equal to). JE LI and write label name. Problem, Compare to be done before jump, so the input is equal or not. We have to compare input & all in this case. Without comparison we can't decide.

· Affee Compairson result ue decide next step. · Compare is needed before jump. · Compare means we have to subtraction method). Compare: Subtracts operand 1 from operand 2 but does not store the result; only changes the flags.

The Subtraction of result is Zao, handled by 2F, ZF is 1 if result is zero. esselt not stored, destination value is changed. . In compare we don't want to store the result. · Flag register change if smult is zero, It check it and jump according to it. changing of flag we jump a wording to it.

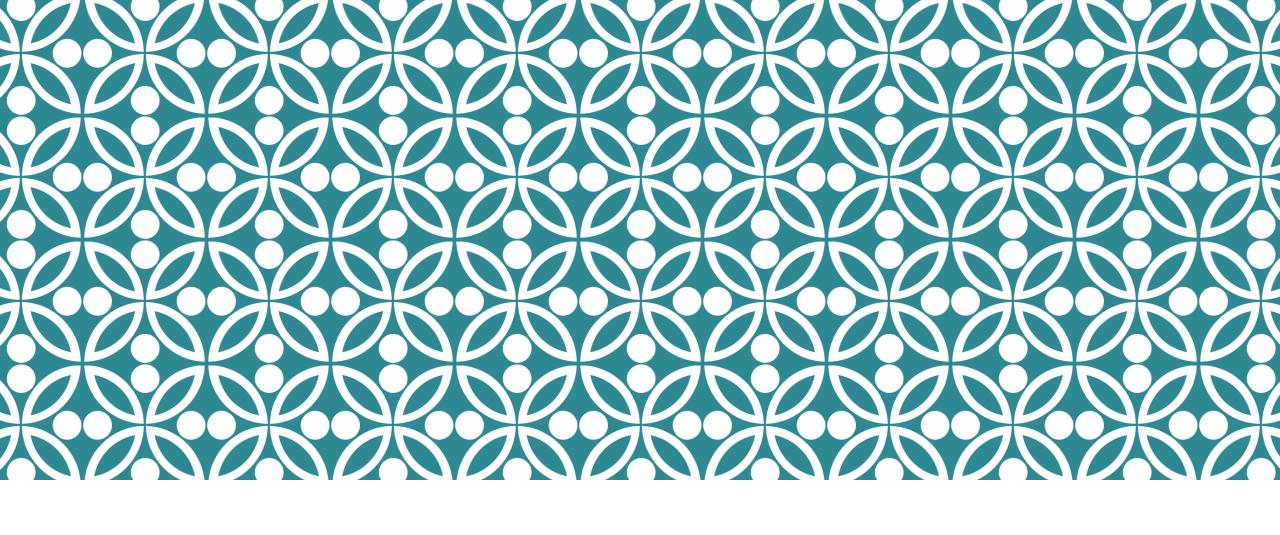

Compare Syntax: Cmp reg, reg comp al, al cmp d1,3' Comp reg, constant cmp dl,[si] Comp reg, [memory add.] · input save in al, 3 is store in all mov ah, 1 . If input is 3, compare value of int 21h. al & al, both 3, subtract mou del, 3 result is zoo, flag register is On Comp al, al It then jump, if both equal it go to flag registee ZF Jump if ZF=1

Jump IF ZF=1 · Backend Historian all oprodes check Bits of lag register. (oprode of conditional jump) · 9, JE check zew flag. Example of 5 comes in al & 3 is in all. Al = 5 Not performed jump, Go downward

DI = 3 JE LI line is ignored. Otcodes (Conditions a/c to nature of program) () JE, JZ jump if equal, jump of zero. jump if not equal, jump if not zero. 2) JNE, JNZ (when al = 5, all = 3) was here.

3 JL , JB jump if less, Tump if below. jump if less or equal, jump if below or equal. 4) JLE, JBE 3. JG, JA jump if greater, jump if above. jump if greater or equal, jump if above or equal. (6) JGE, JAE . If you want to test flag register what happen when I is in on Carryflag. . Direct jump. JC, JP, JA, JS, JT, JI, JD, JO, JZ

· If subtraction performed, pairty add on result, 9
if write jump pairty it jump;

LAB

Knogram to print the input number is equal or not to given number is program. -) One number is placed in register, and number input from user, if equal print mersage equal else not equal. dossegr. · model Small · stack wooh · dala meg 1 db number is equals meg 1 db number isot equals · code main proc 4 to access variable fast, mor ax, edate I heat memory initialiaze. mov ds, ax -> send value to all mou d1, '3' - when input is taken, its ASCII mor ah, 1 code is there. int 21h so ue use (3), In this was al get ascii code

-> compare all and al (11) cmp al, dl je LI > If not equal this line ignordie (je LI), no jump Print MSg2 mor dx, Offset msg2 movah, 9 to exit from this section int alh and avoid autorun of mov ah, 4ch L1, ue woile int 21h mou ah, 4ch int 21h So it exit on this point. mov dx, Offset msg1 99 it equals
Print that solumber is equal mou ah, 9 int 21h 2 exit. mov ah, 4ch int 21h program end. main endp end main
